IN THE CLAIMS:

The following listing of claims will replace all prior versions, and listings, of claims in the application.

1. (Currently Amended) A method for displaying lines on a display device, said method comprising:

generating a plurality of sample positions in a two-dimensional space, wherein the plurality of sample positions correspond to a pixel;

determining a sample normal distance for each of the sample positions with respect to a line in the two-dimensional space;

assigning a plurality of sample values to said plurality of sample positions based on the sample normal distance of each of said sample positions, wherein said assigning comprises:

determining a window value according to a window function for each of said sample positions based on the corresponding sample normal distance, wherein said determining said window value according to said window function for each of said sample positions comprises: multiplying the sample normal distance of each sample position by an anti-aliasing correction factor (ACF) to determine a corresponding scaled distance value; and evaluating said window function at the first scaled distance value;

computing said sample value for each of said sample positions based on the corresponding window value;

operating on said plurality of sample values to determine a pixel value for the pixel;

transmitting the pixel value to a display device.

- 2. (Original) The method of claim 1, wherein said sample values comprise color values.
- 3. (Original) The method of claim 1, wherein said sample values comprise transparency values.

4. (Previously Presented) The method of claim 1, wherein said operating on said plurality of sample values comprises:

spatially filtering said plurality of sample values.

5. (Previously Presented) The method of claim 1, wherein said determining said sample normal distance for each of the sample positions with respect to said line comprises:

computing a vertical displacement between the sample position and the line; and multiplying the vertical displacement by a slope correction factor.

6. (Original) The method of claim 1, wherein said determining said sample normal distance for each of the sample positions with respect to said line comprises:

computing a horizontal displacement between the sample position and the line; and

multiplying the horizontal displacement by a slope correction factor.

7-8 (Cancelled)

- 9. (Original) The method of claim 7, wherein said ACF is greater than one.
- 10. (Original) The method of claim 7, wherein said multiplying the sample normal distance of each sample position by said ACF reduces an apparent width of said line on the displace device.
- 11. (Original) The method of claim 7, further comprising receiving user input determining said ACF.
- 12. (Original) The method of claim 7, wherein the window function is a Gaussian function.

- 13. (Original) The method of claim 7, wherein the window function approaches zero as said sample normal distance increases.
- 14. (Original) The method of claim 7, wherein the window function attains a value of one for said sample normal distance equal to zero.
- 15. (Currently Amended) A graphics system for displaying lines on a display device, the graphics system comprising:

a sample buffer;

a rendering unit configured to (a) generate a plurality of sample positions in a two-dimensional space, wherein the plurality of sample positions correspond to a pixel, (b) determine a sample normal distance for each of the sample positions with respect to a line in the two-dimensional space, (c) assign sample values to said sample positions based on the sample normal distance of each of said sample positions, and (d) store said sample values in said sample buffer;

a pixel calculation unit configured to read said sample values from the sample buffer, operate on said sample values to determine a pixel value for the pixel, and transmit the pixel value to a display device;

wherein said rendering unit is configured to assign sample values to said sample positions based on the sample normal distance of each sample position by:

determining a window value according to a window function for each of said sample positions based on the corresponding sample normal distance; and

computing said sample value for each of said sample positions based on the corresponding window value;

wherein said rendering unit is configured to determine said window value according to said window function for each of said sample positions by:

multiplying the sample normal distance of each sample position by an anti-aliasing correction factor (ACF) to determine a corresponding scaled distance value; and

evaluating said window function at the first scaled distance value.

- 16. (Original) The graphics system of claim 15, wherein said sample values comprise color values.
- 17. (Original) The graphics system of claim 15, wherein said sample values comprise transparency values.
- 18. (Previously Presented) The graphics system of claim 15, wherein said pixel calculation unit is configured to operate on said sample values by spatially filtering said sample values.
- 19. (Original) The graphics system of claim 15, wherein said rendering unit is configured to determine said sample normal distance for each of the sample positions with respect said line by:

computing a vertical displacement between the sample position and the line; and multiplying the vertical displacement by a slope correction factor.

20. (Original) The graphics system of claim 15, wherein said rendering unit is configured to determine said sample normal distance for each of the sample positions with respect to said line by:

computing a horizontal displacement between the sample position and the line; and

multiplying the horizontal displacement by a slope correction factor.

- 21-22 (Cancelled)
- 23. (Original) The graphics system of claim 21, wherein said ACF is greater than one.
- 24. (Original) The graphics system of claim 21, wherein said multiplying the sample normal distance of each sample position by said ACF reduces an apparent width of said line on the displace device.

- 25. (Original) The graphics system of claim 21, wherein said rendering unit is further configured to receive user input determining said ACF.
- 26. (Original) The graphics system of claim 21, wherein the window function is a Gaussian function.
- 27. (Original) The graphics system of claim 21, wherein the window function approaches zero as said sample normal distance increases.
- 28. (Original) The graphics system of claim 21, wherein the window function attains a value of one for said sample normal distance equal to zero.
